Medical Data Analysis Report

Executive Summary

This medical data analysis report provides insights into a dataset of 253973 records, offering valuable information on pharmaceutical products. The analysis reveals trends and patterns in product characteristics, enabling informed decision-making.

Key Findings

* The dataset contains a wide range of products from various manufacturers, including both discontinued and active medications.

* The most common product type is tablets, followed by capsules and injections.

* The majority of products have short compositions 1 and 2, indicating the presence of one or two active ingredients.

Recommendations

* Utilize the data to optimize inventory management by identifying discontinued products and ensuring adequate stock levels for active medications.

* Conduct further analysis to explore the relationship between product characteristics and price, aiding in cost optimization and pricing strategies.

* Leverage the data to enhance patient care by providing comprehensive information on product availability and composition.
